

PW N° 05

DEVELOPMENT OF DATABASE APPLICATION FOR CLASSROOM MANAGEMENT

Create an application (desktop or web) by any programming language (Java or php, etc.) that contains the following interfaces:

1. **Administration:** This involves populating all existing tables (**without Attend table**) and can be divided into various sub-interfaces. For instance, there can be an interface for adding students and groups, another for adding teachers along with their associated modules and module types, and more.
2. **Student Attendance Tracking:** It facilitates populating the Attend table based on the schedule. For a specific student (you can select it from the student table), the application should show the following information:

- Absence with date per module, for example: 2 absences, 03/December, database

1 absence, 03 december, Network

- Attendance Rate: 85% in each week. The rate can be calculated according to the number of sessions in the week. Example: if the total sessions is 16 and one of the student X has 2 absences then the attendance rate is as follows:

Attendance Rate = $100 \times (\text{Total session} - \text{Absences}) / \text{Total session}$. So, the attendance rate of student X is: $100 \times (16 - 2) / 16 = 87,5\%$

3. **Teacher Attendance Tracking:** the same as the Student but the total sessions are related to the module's teacher in the week. For example, teacher Aggoune has as the total sessions per week is 3 (course, TW, and PW).
